Prof. Xiaowei Zhuang

How MERFISH Works

Chen et al. Science 2015

Binary barcode design

MERFISH: Multiplexed Error Robust Fluorescent In Situ Hybridization

Is a technique that allows the identification of multiple RNA molecules (up to 500 targets) using a **combinatorial fluorescent labeling approach**

Step 1:

- A **unique** binary code (aka word/barcode) made of "0" or "1" bits is assigned to each RNA target
- Numbers of bits is the **same** for all targets (ex. 18 bits its for 140 gene panel)

	Binary code/word/barcode	Bit
RNA Target 1	0 0 0 0 1 1 1 0 0 0 0 0 0 0 1 0 0 0	
RNA Target 2	0 0 0 0 1 0 1 0 0 0 0 0 1 0 0 0 0 1 0 0	
RNA Target 3	1 0 0 0 1 0 1 0 0 0 0 0 0 1 0 0 0 0 0 0	
RNA Target 4	0 0 1 0 1 0 1 1 0 0 0 0 0 0 0 0 0 0 0 0	
RNA Target 5	0 0 0 0 1 1 0 1 0 0 0 0 1 0 0 0 0 0 0 0	
RNA Target 6	0 0 0 0 0 1 0 0 1 1 0 0 0 0 0 1 0 0 0 0

Encoding a binary barcode for MERFISH

MERFISH: Multiplexed Error Robust Fluorescent In Situ Hybridization

What does a bit of 1 or 0 mean in the context of in situ hybridization?

1= fluorescent
signal on the
sample

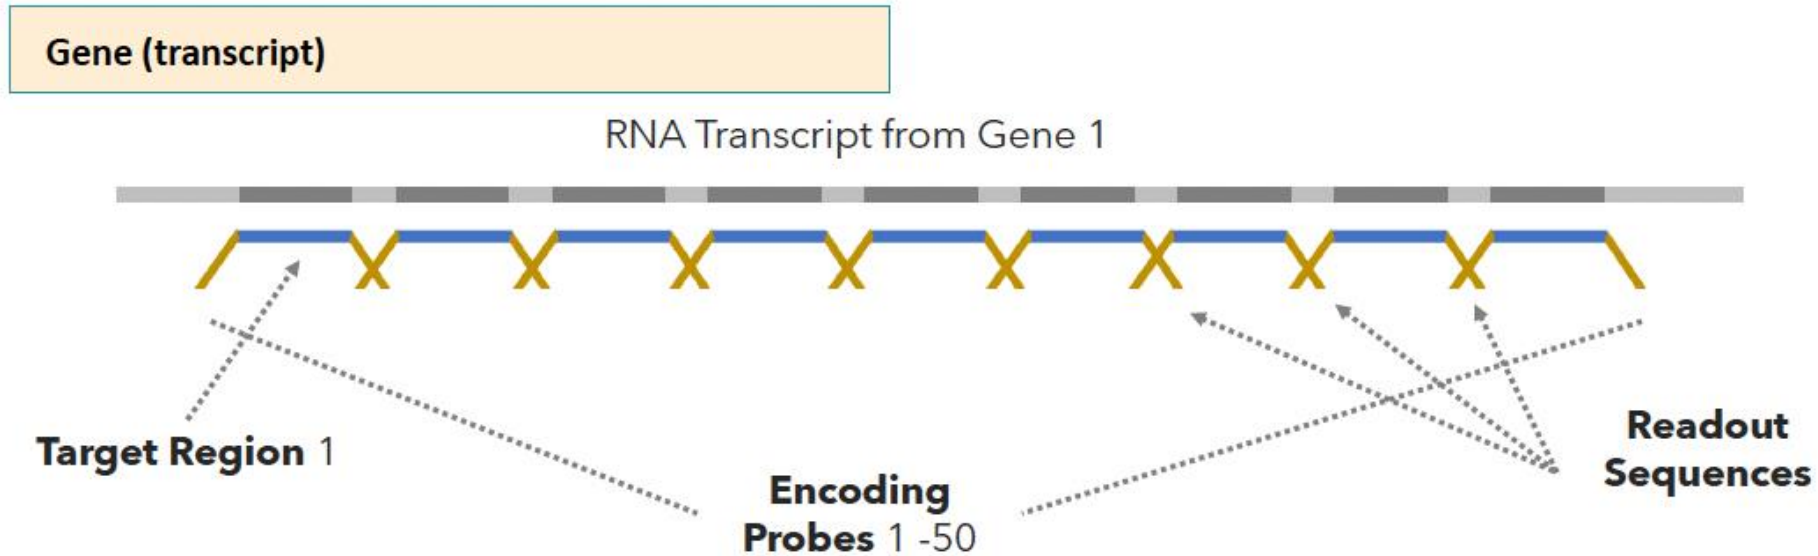

0=no signal on the
sample

Probe Hybridization Principle

MERFISH: Encoding probe hybridization

Step 2:

- **Encoding** probes are hybridized to the sample for 36h for ALL targets (140, 300 or 500)

Imaging through the bits

MERFISH: Round 1 of hybridization

Step 3:

- For each **single bit position**, starting with **bit position 1**, fluorescently labelled **readout** probes are hybridized to **ALL** transcripts that have been assigned to have '1' in that specific bit position

	Bit position 1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
RNA Target 1	0	0	0	0	1	1	1	0	0	0	0	0	0	0	1	0	0	0
RNA Target 2	0	0	0	0	1	0	1	0	0	0	0	1	0	0	0	1	0	0
RNA Target 3	1	0	0	0	1	0	1	0	0	0	0	0	1	0	0	0	0	0
RNA Target 4	0	0	1	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0
RNA Target 5	0	0	0	0	1	1	0	1	0	0	0	1	0	0	0	0	0	0
RNA Target 6	1	1	0	0	0	1	0	0	1	0	0	0	0	0	0	0	0	0
RNA Target 140																		

Ex. this fluorescent signal can be target **3** or **6** signal. This information is **recorded** and **stored**

Step 3:

- All signals are then **photobleached**

Imaging through the bits

MERFISH: Round 2 of hybridization

Step 4:

- Continuing with **bit position 2** only, fluorescently labelled **readout** probes are hybridized to **ALL** transcripts that have been assigned to have '1' in that bit position.

	Bit position 1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
RNA Target 1	0	0	0	0	1	1	1	0	0	0	0	0	0	0	1	0	0	0
RNA Target 2	0	0	0	0	1	0	1	0	0	0	0	1	0	0	0	1	0	0
RNA Target 3	1	0	0	0	1	0	1	0	0	0	0	0	1	0	0	0	0	0
RNA Target 4	0	0	1	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0
RNA Target 5	0	0	0	0	1	1	0	1	0	0	0	1	0	0	0	0	0	0
RNA Target 6	1	1	0	0	0	1	0	0	1	0	0	0	0	0	0	0	0	0
RNA Target 140																		

This fluorescent signal can be target **6** (but not 3). This information is **recorded** and **stored**

Step 5:

- All signals are photobleached

Imaging through the bits

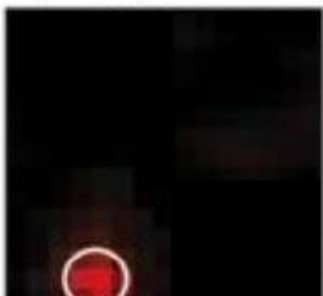

MERFISH: Last round of hybridization

- The process is repeated for all the bits

	Bit position	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
RNA Target 1		0	0	0	0	1	1	1	0	0	0	0	0	0	0	1	0	0	0
RNA Target 2		0	0	0	0	1	0	1	0	0	0	0	1	0	0	0	1	0	0
RNA Target 3		1	0	0	0	1	0	1	0	0	0	0	0	1	0	0	0	0	0
RNA Target 4		0	0	1	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0
RNA Target 5		0	0	0	0	1	1	0	1	0	0	0	1	0	0	0	0	0	0
RNA Target 6		1	1	0	0	0	1	0	0	1	0	0	0	0	0	0	0	0	0

RNA Target 140

When a specific pattern of 1s and 0s across all bit positions matches an assigned binary code then the identity of the gene is known

This fluorescent signal showed up on bit position 1, 2, 6 and 9. Hence it is target **6**

Error-Robust Feature Identification

MERFISH: Multiplexed Error Robust Fluorescent In Situ Hybridization

- Each binary code has **four** 1 bits only to minimize error (1 to 0 more common than 0 to 1 hence 1s are kept to a minimum)
- 1s and 0s across genes are arranged following a **Hamming distance of 4 (HD4)**
 - One of the words has to flip four bits from '1' to '0' or '0' to '1' to convert into the other word.
 - Anything <4 can be identified and **potentially** corrected

Hamming Distance 4

1 1 0 0 0 0 0 1 0 0 0 0 0 0 1 0
↓ ↓ ↓ ↓
0 1 0 0 0 0 0 1 0 0 0 1 0 0 0 1

Single Error Correction

1 1 0 0 0 0 0 1 0 0 0 0 0 0 1 0
↓
1 0 0 0 0 0 0 1 0 0 0 0 0 0 1 0

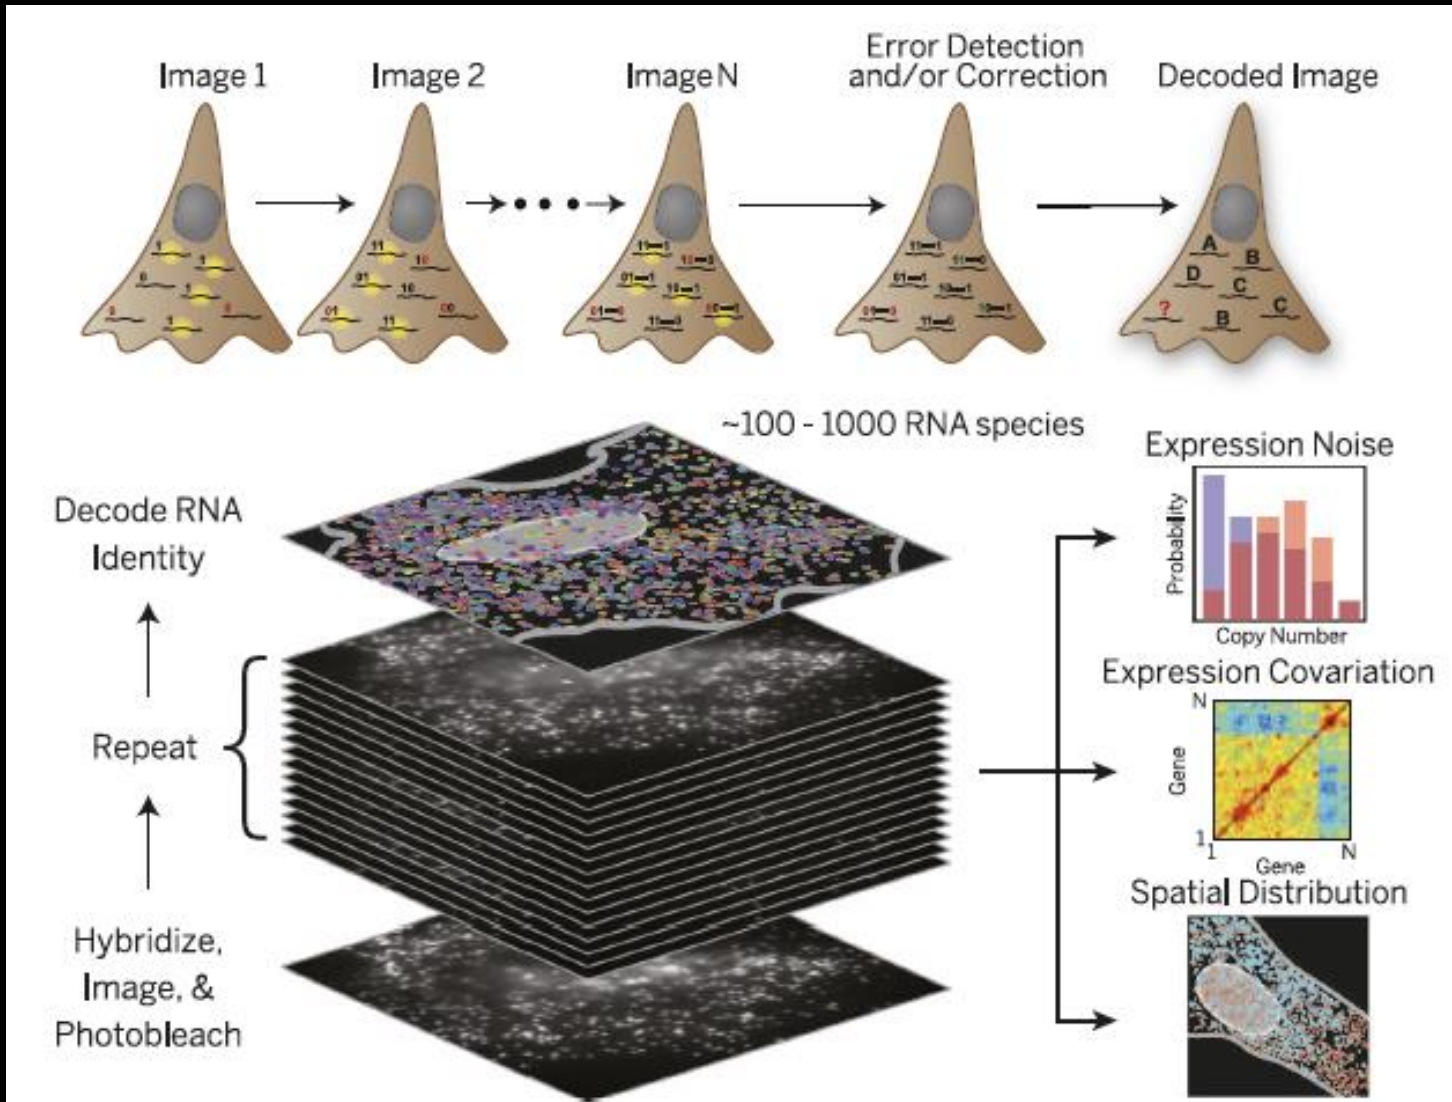

3 errors → Other codewords

Double Error Detection

1 1 0 0 0 0 0 1 0 0 0 0 0 0 1 0

Summary

- Recent advent of **genome-scale imaging** has enabled **single-cell omics** analysis in a **spatially resolved manner** in intact cells and tissues.
- These advances allow **gene expression profiling of individual cells**, and hence **in situ identification** and **spatial mapping of cell types** in complex tissues (heart and kidney).
- Use of **FFPE material for MERFISH** has high translational potential
- The high spatial resolution of MERFISH further allows determination of the **spatial organization of the genome and transcriptome with subcellular resolution.**
